Air Distribution

Notes

Dimensions stated in this brochure are in mm.

Dimensions stated in this brochure are subject to General Tolerances according to DIN ISO 2768-vL.

The actual specifications are available as a word document at your local distributor or at www.LTG.de.

The flow rate controllers VRE, VRF, VREactive and VRFactive are designed to be installed in air-conditioning systems in accordance with DIN 60 Sheets 1+2 and DIN 1946 Sheet 2.

The aforementioned standards, in particular DIN 1946-2 which has been superseded by DIN EN 13779, relate to DIN EN 13779, which in turn refer to the standards DIN EN 12237 and DIN EN 1507. The tightness classes quoted in the standards must be enquired depending on the product design.

Technical brochure • Variable flow rate controllers VRE, round

Flow Rate Control Basics – Which Product for which Application?

Plant types

Variable Flow Rate

Units with variable flow rates (VVS) use electronic flow rate controllers providing the room with exactly the required air volume – according to function and energy efficiency.

Constant Flow Rate

Units with constant flow rates (KVS) use flow rate controllers maintaining a constant flow rate mechanically system-powered. Working with no wiring or external power supply, they provide convenient and cost-saving solutions.

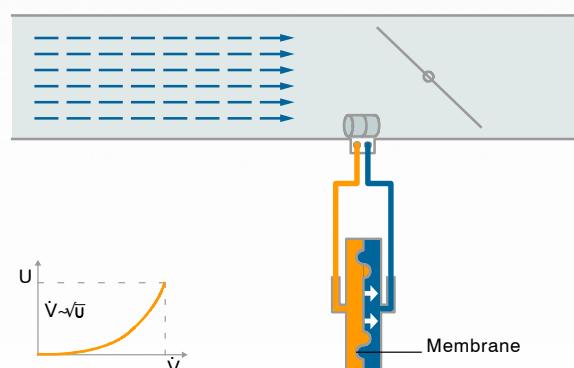

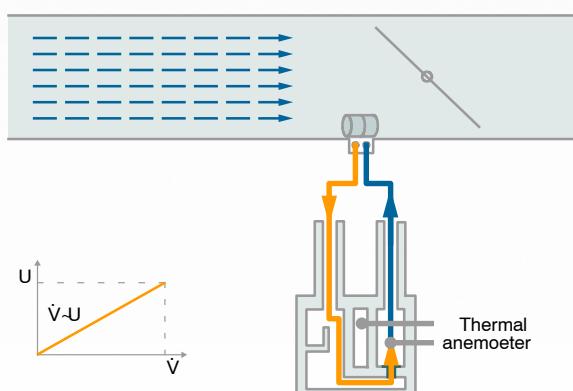

Measuring Methods

Dynamic Differential Pressure Management

Dynamic methods measure part of the air that is guided through the differential pressure transducer. Dynamic differential pressure measuring makes economical sense in plants where no dust and/or chemical pollution of the air is expected, potentially leading to the contamination of sensors (e. g. administration and office buildings, museums, etc.).

Static Differential Pressure Management

Static differential pressure measurement uses a diaphragm pressure transducer. With this method, no air is guided through the sensor, so no dust or chemical pollution by the air is possible and hence, may well be used in such environments.

Technical brochure • Variable flow rate controllers VRE, round

Measuring principle VRE

The continual constriction in the cross-section of a measuring orifice with defined aperture ratio creates a static differential pressure (= active pressure) between the inflow and outflow sides during air flow.

With this method the flow rate depends only on the active pressure.

The active pressure is tapped in front of and behind the orifice using a pair of measuring tappings (plus and minus pressure tapping). Since it is not the dynamic pressure in the air flow which is measured, unlike in other active pressure transducers (e.g. measuring cross), the risk of contamination of the measuring holes is lower.

Depending on the make of the attached sensor, the measurement in the sensor can be dynamic or static.

In the dynamic measurement the pressure gradient at the orifice is used to generate in the pressure transducer a low bypass airflow from plus to minus pressure tapping.

The air flow is routed via a thermal anemometer of which the output voltage is proportional to the flow velocity inside the damper housing.

The measurement value is independent of the installation position of the sensor..

Since there is a flow through the sensor, it is unsuitable for air that contains dust or is contaminated by chemicals.

In the static measurement the chambers of the pressure transducer are separated by a diaphragm. The diaphragm is deformed by the pressure difference and leads to a change in the electrical capacitance.

The pressure transducer is calibrated here such that the output signal is proportional to the flow velocity in the damper housing.

With simple diaphragm sensors without position compensation, the measurement value is position-dependent on account of the weight of the diaphragm itself, which is why a zero point calibration might be necessary.

The sensor is suitable for air that contains dust or is contaminated by chemicals, as there is no flow through it.

Control accuracy

Deviations from the set value: $\pm 5\%$ of V_{nenn} (10 m/s)

Installation position

The flow rate controller must be installed with due attention to the airflow direction arrow affixed to the housing and with the damper axis horizontal.

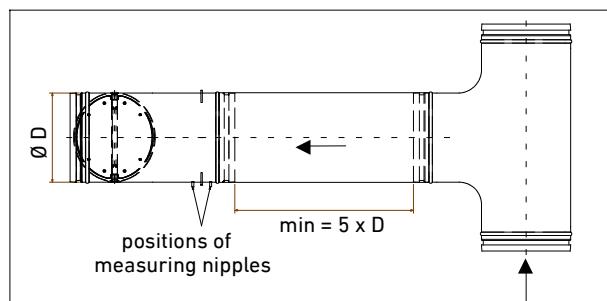

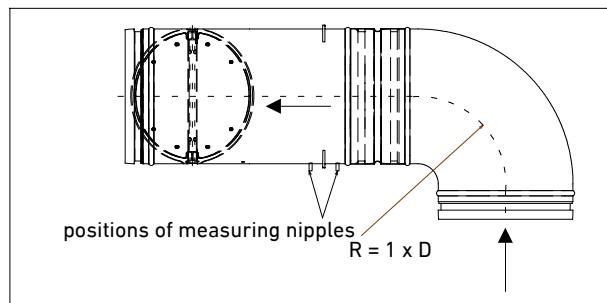

The differential pressure sensor of the attached compact controller, Sauter model ASV115, is position-independent.

In the case of other control components with static differential pressure sensor, the permissible installation position of the sensor can be found in the technical documents valid in each case. If necessary, a zero point adjustment must be conducted.

Required straight inflow distances

A straight, undisturbed inflow distance „min“ in front of the flow rate controller - acc. to the following illustrations - is required. A 90° bend can be connected without a straight inflow section to the flow rate controller. If a branch is connected, a straight inflow section of at least $5 \times D$ is required. Care must be taken with the positions of the measuring nipples to ensure that the specified control accuracy is achieved.

There are, however, no restrictions regarding the outflow side

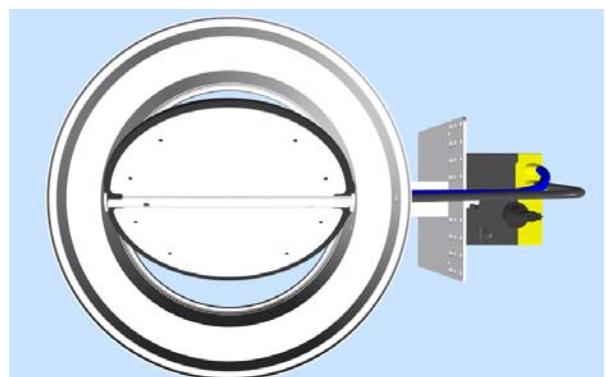

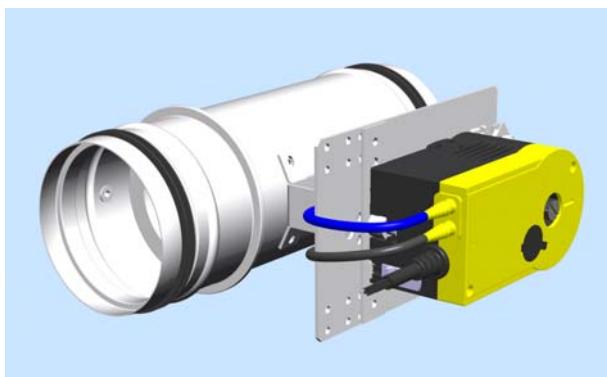

D - Diameter

min - minimum inflow distance for a control accuracy of $\pm 5\%$ of V_{nenn}

If a combination of fittings that is unfavourable with view to the air flow is unavoidable, the minimum distance is several times the given Min.

Views of unit

Inside view in the direction of air flow

Application

The round flow rate control unit VRE is designed to control an initial pressure-independent constant or variable air flow.

Configuration

VRE units comprise of housing, flow rate measuring element with sensor, damper blade with actuator and controller. The housing is provided with plug-in end pieces with insertion groove for a lip-seal gasket, to fit air ducts according to DIN EN 1506 or EN 13180.

Mode of operation

The flow rate is measured using a measuring orifice as an active pressure transducer and with a differential pressure sensor, the measured differential pressure being the dimension for the flow rate.

The controller compares the actual value measured by the sensor with the setpoint value, and corrects the divergence by altering the damper setting using the actuating drive.

Control and regulation are achieved with external energy, either electric or pneumatic depending on the chosen design.

All components are factory-wired and hose-connected.

The flow rate controllers are rated for air velocities of 1...10 m/s.

Depending on the size, the control component and the set flow rate, the minimum pressure difference is approx. 10...130 Pa.

The damper blade closes air-tight in accordance with DIN EN 1751, complete shut-off is also possible.

To reduce sound emission, the flow rate controller can be optionally retrofitted with an insulating case and/or a silencer.

The mechanism is universally suitable for the attachment of various controller makes and combinations of controllers, sensors and actuators for specific applications too.

The control components also differ here in the measuring principle (dynamic/static), in their actuator function (running time, standby setting) and in their operation (with / without bus mode).

With a static measuring principle of the sensor and a corrosion-resistant design (coated or stainless steel), the flow rate controller is suitable for aggressive media, for example laboratory waste air (resistance verification required).

For rapid and stable control of critical applications, e.g. in laboratory and pharmaceutical applications, controllers with high-speed actuators are available.

If a standby setting function is required, actuators with spring return or SuperCaps are used.

Materials, finishes

- Housing, damper, axle, measuring probes of galvanized steel
- Damper bearings of POM plastic
- Sealings of EPDM

Accessories, special versions

- Insulating case for sound and heat insulation
- Plug-in end pieces with lip-seal gasket on both sides
- Flanges according to DIN 24154 R1 at both ends and counterflanges (loose)
- Pipe ends at both ends with flange and clamping rings with ring seal
- Additional pressure tapping points for parallel active pressure/flow rate measurement
- All metal parts within the air flow are made of V4A
- Housing and orifice with PUR finish RAL 9010 (damper blade, axle, measuring nipple of stainless steel V4A)
- Controller with dynamic differential pressure sensor
- Communication via MP-Bus or LON
- Actuator with spring return
- High-speed actuator
- Flexible sound absorber SDE-A0 made of aluminium
- Rigid sound absorber SDE-S0 made of galvanized sheet steel

Additional accessories and special versions by request.

Connection

Notes and circuit diagrams for regulating the flow rate can be found in the operating and maintenance instructions.

Technical brochure • Variable flow rate controllers VRE, round Type VRE-./.../S, made of steel

Control

Made by Sauter, model ASV115CF132E (standard)

- Electronic VAV compact controller, supply 24V AC/DC
- Position-independent sensor with static measuring principle, suitable for aggressive media and contaminated air
- Running time of actuator 30...120 s parametrizable
- Torque of actuator 10 Nm, for sizes up to DN 630
- Analog control with 0(2)...10 V
- Control as switch command via two independent digital inputs (override controls CLOSE, OPEN, V_{min} and V_{max} with external potential-free switches is possible)
- Feedback of actual value analog with 0...10 V
- Communication via RS485 bus interface (max. 31 controllers)
- Parametrization of set values and inputs/outputs using SAUTER CASE VAV software
- Second control circuit for room pressure or room temperature control by connection of an appropriate sensor

Example for application of a VAV room temperature cascade controller

In combination with an Ni1000 temperature sensor, the VAV compact controller regulates the air change in the room, depending on the temperature control divergence (cooling sequence). The VAV compact controller can also operate a continuous valve actuator of an after-heater / radiator or of an after-cooler. A room temperature setpoint value can be specified from outside or permanently set in the VAV compact controller. All control functions and parameters of the temperature controller can be set using the software tool in the VAV compact controller.

Output or status signals (from VAV compact controller to DDC/BMS)

1. Flow rate actual value via analog output 0...10 V
2. Setting signal for valve actuator via analog output 0...10 V

Input or control signals (from DDC/BMS to VAV compact controller)

1. Room temperature setpoint value (variable control) via analog input: 0...10 V
2. Room temperature actual value via digital input / NI1000
3. Flow rate setpoint value (priority control) via digital input

Application ranges, limits

Valid for Sauter ASV115CF132E controller. With other controller models, divergences are possible.

- Minimum air speed 1 m/s
- Nominal air speed 10 m/s
- Static over-pressure in the air duct based on ambient pressure up to 1000 Pa
- Static under-pressure in the air duct based on ambient pressure 750 Pa max.
- Leakage flow rate via shut damper blade Class 4 acc. to DIN EN 1751 (DN 100 and 125: Class 3)
- Leakage flow rate via casing Class A acc. to DIN EN 1751 (optional Class C)
- Operating temperature range 0 ...+50 °C at <85 % rh, non-condensing
- Suitable for polluted or contaminated air flows (resistance verification required)
- Installation with horizontal damper axle only
- Free suction with upstream air duct or via fitting only

Recommendation for selection

- Air speed up to 7 m/s
- Damper pressure loss up to 500 Pa
- If sound emission via air duct surfaces is critical, all ducts including the controller must be sound insulated up to the sound absorber

Casing sound emission data given in the chart refer to the emitting jacket surface of a duct of galvanized sheet steel, total length 6 m, with the flow rate controller installed. Due to resonance effects given frequency-related sound power level data may vary by +/- 6 dB max.

Δp_{ges} - total pressure difference
 f_m - octave mid-band frequency
 L_W - sound power level
 L_{WA} - sound power level, A-weighted
 L_{pA} - sound pressure level, A-weighted

Technical brochure • Variable flow rate controllers VRE, round Type VRE-./.../S, made of steel

Room sound pressure level calculation from controller sound transmission (excluding flow noise from the air diffusers)

System attenuation according to VDI 2081

Nomenclature, ordering code

VRE -S 100 / S / D / L / A / C541

(1) (2) (3) (4) (5) (6) (7) (8)

(1) Series	VRE	= Variable flow rate controller, round
(2) Measuring principle	S	= dynamic
	-S	= static
(3) Size resp. Ø	100	= 100
	125	= 125
	160	= 160
	200	= 200
	250	= 250
	315	= 315
	400	= 400
	500	= 500
	630	= 630
(4) Version	S	= Galvanized steel
	E	= Stainless steel V4A
	K	= PUR-coated, RAL 9010
(5) Insulating case	-	= Without insulating case
	D	= With insulating case
(6) Connection	-	= Plug-in end pieces
	L	= Plug-in end pieces with lip-seal gasket
	B	= Bord 6 mm for clamping ring connection
	F	= Flange acc. to DIN 24154 R1
(7) Leak-tightness of housing	A	= Class A acc. to DIN EN 1751
	C	= Class C acc. to DIN EN 1751
(8) Controller type	C541	= Sauter ASV115CF132E (standard, other controller types see last page)

Additional ordering specifications

- V_{min} [m³/h]
- V_{max} [m³/h]
- Mode 0...10 V or 2...10 V
- Regulating time: 30...120 s

Please notice: V_{nenn} see page 6

$$\begin{aligned} V_{min} &\leq V_{max} \\ V_{max} &\leq V_{nenn} \\ V_{min} &\geq 0.064 \times V_{nenn} \end{aligned}$$

In the absence of such specifications the unit will be delivered with the following factory settings:

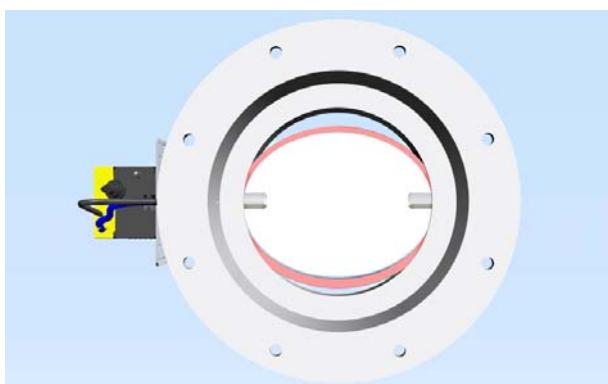

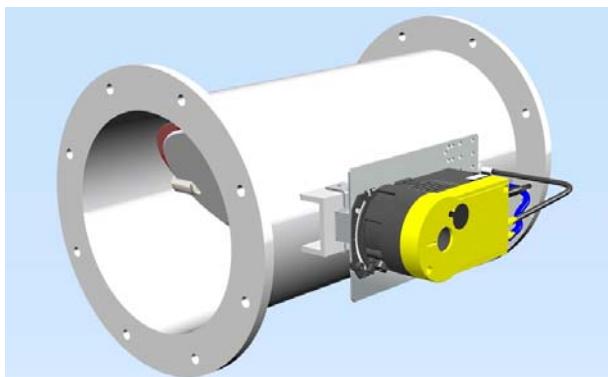

- V_{min} = $0.1 \times V_{nenn}$
- V_{max} = V_{nenn}
- Mode = 0...10 V
- Regulating time: 30 s

Ordering example

VRE-S 100/S/D/L/A/C541, V_{min} = 100 m³/h, V_{max} = 200 m³/h, Mode 2...10 V, regulating time 120 s

Technical brochure • Variable flow rate controllers VRE, round Type VRE-./.../P, made of PPs

Views of unit

Inside view in direction of air flow

Application

The round flow rate controllers VRE made of plastic PPs are designed to control an initial-pressure independent constant or variable flow rate in plants with aggressive media.

Configuration

VRE units comprise of housing, flow rate measuring element with sensor, damper blade with actuator and controller.

The housing is provided with pipe sockets to fit air ducts according to DIN 8077.

Mode of operation

The flow rate is measured using a measuring orifice as an active pressure transducer and with a differential pressure sensor, the measured differential pressure being the dimension for the flow rate.

The controller compares the actual value measured by the sensor with the setpoint value, and corrects the divergence by altering the damper setting using the actuating drive.

Control and regulation are achieved with external energy, either electric or pneumatic depending on the chosen design.

All components are factory-wired and hose-connected.

The flow rate controllers are rated for air velocities of 1...10 m/s.

Depending on the size, the control component and the set flow rate, the minimum pressure difference is approx. 10...130 Pa.

The damper blade closes tight in accordance with DIN EN 1751, so that a complete shut-off is also possible.

To reduce sound emission, the flow rate controller can be optionally retrofitted with an insulating case and/or a silencer.

The mechanism is universally suitable for the attachment of various controller makes and combinations of controllers, sensors and actuators for specific applications too.

The control components also differ here in the measuring principle (dynamic/static), in their actuator function (running time, standby setting) and in their operation (with / without bus mode).

With a static measuring principle of the sensor, the flow rate controller is suitable for aggressive media, for example laboratory waste air (resistance verification required).

For rapid and stable control of critical applications, e.g. in laboratory and pharmaceutical applications, controllers with high-speed actuators are available.

If a standby setting function is required, actuators with spring return or SuperCaps are used.

Materials, finishes

- Housing, damper and measuring probe: polypropylene, hardly inflammable (PPs)
- Damper bearing, damper axle: polypropylene (PP)
- Bearing sealings: Ethylen-Propylen-Dien-Kautschuk (EPDM)
- Damper sealing: polyurethane (PU)

Accessories, special versions

- Insulating case for sound and heat insulation
- Pipe ends on both sides with flanges and mating flanges (loose)
- Pipe ends on both sides with sleeve
- Additional pressure tapping points for parallel active pressure/flow rate measurement
- Controller with dynamic differential pressure sensor
- Communication via MP-Bus, LON, ...
- Actuator with spring return
- Actuator with normal running time
- Pipe silencer SDE-PO of PPs

Additional accessories and special versions on request.

Connection

Notes and circuit diagrams for control components can be found in the operating and maintenance instructions.

Technical brochure • Variable flow rate controllers VRE, round Type VRE-./.../P, made of PPs

Control

Made by Sauter, model ASV115CF152E (standard)

- Electronic VAV compact controller, supply 24 V AC/DC
- Position-independent sensor with static measuring principle, suitable for aggressive media and contaminated air
- Running time of actuator 3...15 s parametrizable
- Torque of actuator 10 Nm, suitable for sizes up to DN 630
- Analog control with 0(2)...10 V
- Control digital via 2 switch inputs:
override controls CLOSE, OPEN, V_{min} and V_{max}
- Feedback of actual value analog with 0...10 V
- Communication via RS485 bus interface (max. 31 controllers)
- Parametrization of set values and inputs/outputs using SAUTER CASE VAV software
- Second control circuit for room pressure or room temperature control by connection of an appropriate sensor

Example for application of a VAV room pressure cascade controller

In combination with a static room pressure sensor with symmetrical measuring range, the VAV compact controller independently regulates the specified positive or negative pressure in clean rooms, airlocks, operating areas or laboratories. The room pressure is controlled via the parametrizable room pressure cascade flow rate controller integrated into the VAV compact controller. The room pressure is controlled in accordance with user specifications via the VAV compact controller for waste air or supply air. To achieve the maximum room pressure constancy, the room pressure control is only permissible with flow rate controllers for the supply air and waste air.

A switchover between positive and negative pressure control (septic/aseptic operating mode) can be achieved using a switching contact. All control functions and parameters of the room pressure control circuit can be parametrized using the software tool in the VAV compact controller. The measurement range and the output signal of the connected room pressure sensor can be freely defined.

Flow rate range, minimum pressure difference

For other pressure differences and flow rates, the sound levels can be ascertained with our design program.

Δp_{ges} - total pressure difference
 f_m - Octave mid-band frequency

L_W - Sound power level

L_{WA} - Sound power level, A-weighted

L_{pA} - Sound pressure level, A-weighted

Casing sound emission data given in the chart refer to the emitting jacket surface of a duct of galvanized sheet steel, total length 6 m, with the flow rate controller installed. Due to resonance effects given frequency-related sound power level data may vary by +/- 6 dB max.

Δp_{ges} - total pressure difference
 f_m - octave mid-band frequency
 L_W - sound power level
 L_{WA} - sound power level, A-weighted
 L_{pA} - sound pressure level, A-weighted

Technical brochure • Variable flow rate controllers VRE, round Type VRE-./.../P, made of PPs

Room sound pressure level calculation from controller sound transmission (excluding flow noise from the air diffusers)

System attenuation according to VDI 2081

f_m	[Hz]	63	125	250	500	1000	2000	4000	8000
Deflection $\Delta L_{W \text{ Okt}}$	[dB/Okt]	0	0	1	2	3	3	3	3
Room attenuation $\Delta L_{W \text{ Okt}}$	[dB/Okt]	5	5	5	5	5	5	5	5
Outlet reflection $\Delta L_{W \text{ Okt}}$	[dB/Okt]	10	5	2	0	0	0	0	0

Branching attenuation for distributing the sound power over multiple rooms, $V_{\text{room}} = 540 \text{ m}^3/\text{h}$

V	[m ³ /h]	540	1080	2160	5400	10 800
$\Delta L_{W \text{ Okt}} = 10 \times \lg \frac{V}{540 \text{ m}^3/\text{h}}$	[dB/Okt]	0	3	6	10	13

Sample calculation sound transmission

Given: VRE 250 with silencer SDE-PO 1000 mm long
 $V_{\text{max}} = 668 \text{ m}^3/\text{h}$, equates to 4 m/s
 $\Delta p_{\text{ges}} = 150 \text{ Pa}$

Required: Room sound pressure level L_{pA} from controller sound transmission

Solution:	f_m	[Hz]	63	125	250	500	1000	2000	4000	8000	Source

	M	= Bushing
(8) Controller type	C540	= Sauter ASV115CF152E (standard, other controller types see last page)

Additional order specifications

- V_{min} [m³/h]
- V_{max} [m³/h]
- Mode 0...10 V or 2...10 V
- Regulating time: 3...15 s

Please notice: V_{nenn} see page 15
 $V_{min} \leq V_{max}$
 $V_{max} \leq V_{nenn}$
 $V_{min} \geq 0,064 \times V_{nenn}$

In the absence of such specifications the unit will be delivered with the following factory settings

- V_{min} = $0,1 \times V_{nenn}$
- V_{max} = V_{nenn}
- Mode = 0...10 V
- Regulating time: 3 s

Ordering example

VRE-S 110/P/D/-/C540, $V_{min} = 100$ m³/h, $V_{max} = 200$ m³/h, Mode 2...10 V, regulating time 15 s

Product Overview

LTG Air Diffusion

Flow Rate Controllers

Round		Square	
Variable	VRE <i>active</i>	VRF <i>active</i>	LTG Map Control System ActiveControl. Highest precision, short installation length
Constant	VRD	VRF	To combine with customized drives; also available in PPS
VRW	Without external power supply, pollution-insensitive	VRX	Without external power supply, pollution-insensitive
VRZ			

All variable flow rate controllers are available with dynamic or static measuring principle

Pressure Controllers

Round		Square	
	DRE		DRF

Special Products

	SDE/SDF	Inline, cross-talk, and splitter silencers
	VRC+NE	Variable flow rate controller with silencer and reheating register
	VRW-A	Constant control and shut-off unit
	KLB	Ultra-tight shut-off damper (airtight acc. to DIN EN 1751: Class 4)
	ARE /ARF	Airtight shut-off damper (airtight acc. to DIN EN 1751: Class 4)
